

Create the app that will show the list of the newest articles from reddit.com. The application should contain two views:

- paginated list of newest articles
- content of the article + comment form

List of articles is a main view, after click on some of list entries, user should be moved to the content of article. The article view should contain: title, content, comment form and back link to the list.

Important: Because creating of comment requires oauth authentication, it will be enough if you will mock the endpoint responsible for comment's adding (faked endpoint).

Requirements:

- application should be written with AngularJS 1 (<https://angularjs.org/>) or React (<https://facebook.github.io/react/>)
- it should be a single page app (http://en.wikipedia.org/wiki/Single_page_application)
- minify the project with webpack (<https://webpack.github.io>)
- use bootstrap 3 as a template (<http://getbootstrap.com/>)
- enclose project with unit tests
- project should be shared on Github (<https://github.com/>)
- use reddit API (<http://www.reddit.com/dev/api>)

What will be evaluated:

- correct functioning of the app (40pkt)
- code readability, documentation, used design patterns etc. (30pkt)
- minifying (15pkt)
- tests (15pkt)

There is a possibility to achieve some bonus points for a usage of tools/library/solutions that were not listed in the requirements section.
